Module 4

Designing my portfolio was easily my favorite portion of this project. As an IT major who especially enjoys web design and development, I found this process enjoyable. In my free time I create website templates and components. Doing small personal projects like this before I work on school assignments helps by getting my brain in productivity mode while I get to do something I enjoy. I was able to apply all the skills I'm familiar with when it comes to web design to create a blog site that satisfied the requirements for the project. I opted to create and host my own site so that I can stand out. I was tempted to make a very unorthodox design that would've been cool, but not a very good functional website. I chose to make it look like it could be published today and look appealing.

Out of all the classes I've taken across all of UC's campuses, this one helped me the most due to the daily communication. Most other classes I had taken, while this class was focused on group discussion and application of already known topics. I valued Tuesday and Thursday mornings the most. I learned some communication skills that allow me to better relate with my peers. The postcard organization activity was helpful so I could practice group problem solving issues.
